

ADMINISTRATOR

Central management tool for e-DATA
Biometric Access Control systems
across multiple locations

e-data.com | 866.807.3549

ADMINISTRATOR

- Multiple-site management tool for configuration of e-DATA Biometric Access Control users, credentials, scheduling and more from one central location
- Supports multiple Web user access via any standard browser

HOW IT WORKS

The Administrator is a hosted Web application designed for managing e-DATA Biometric Access Control systems across multiple locations.

Within the Administrator application, you create Administration Units that provide a means to group resources from one or many locations.

Administrative accounts called Web Users are assigned to one or many Administration Units. Once logged in, the Web User will see only the resources defined under the Administration Units they are assigned. This simplifies administrative tasks.

All settings, including fingerprint templates, are stored individually at each location Master Unit and collectively under the Administrator database. This protects against lost configuration settings and fingerprint templates.

When a Web User makes a configuration change under the Administrator application, only the settings for the updated locations are changed.

All managed locations check for configuration changes within the Administrator database. Upon finding a change, the location Master Unit retrieves and applies the changes.

HOW IT CONNECTS
