- > Supports third-party integration

## HOW IT WORKS

AXIAL is a .NET client application for managing persons and reporting of e-DATA Access Control systems across multiple locations.

AXIAL provides an administrative interface to all managed system settings, including fingerprint templates. Authorization and site assignment of persons are performed from the AXIAL application and applied to the selected locations. Keeping the intelligence at each individually managed location provides redundancy of critical configuration data.

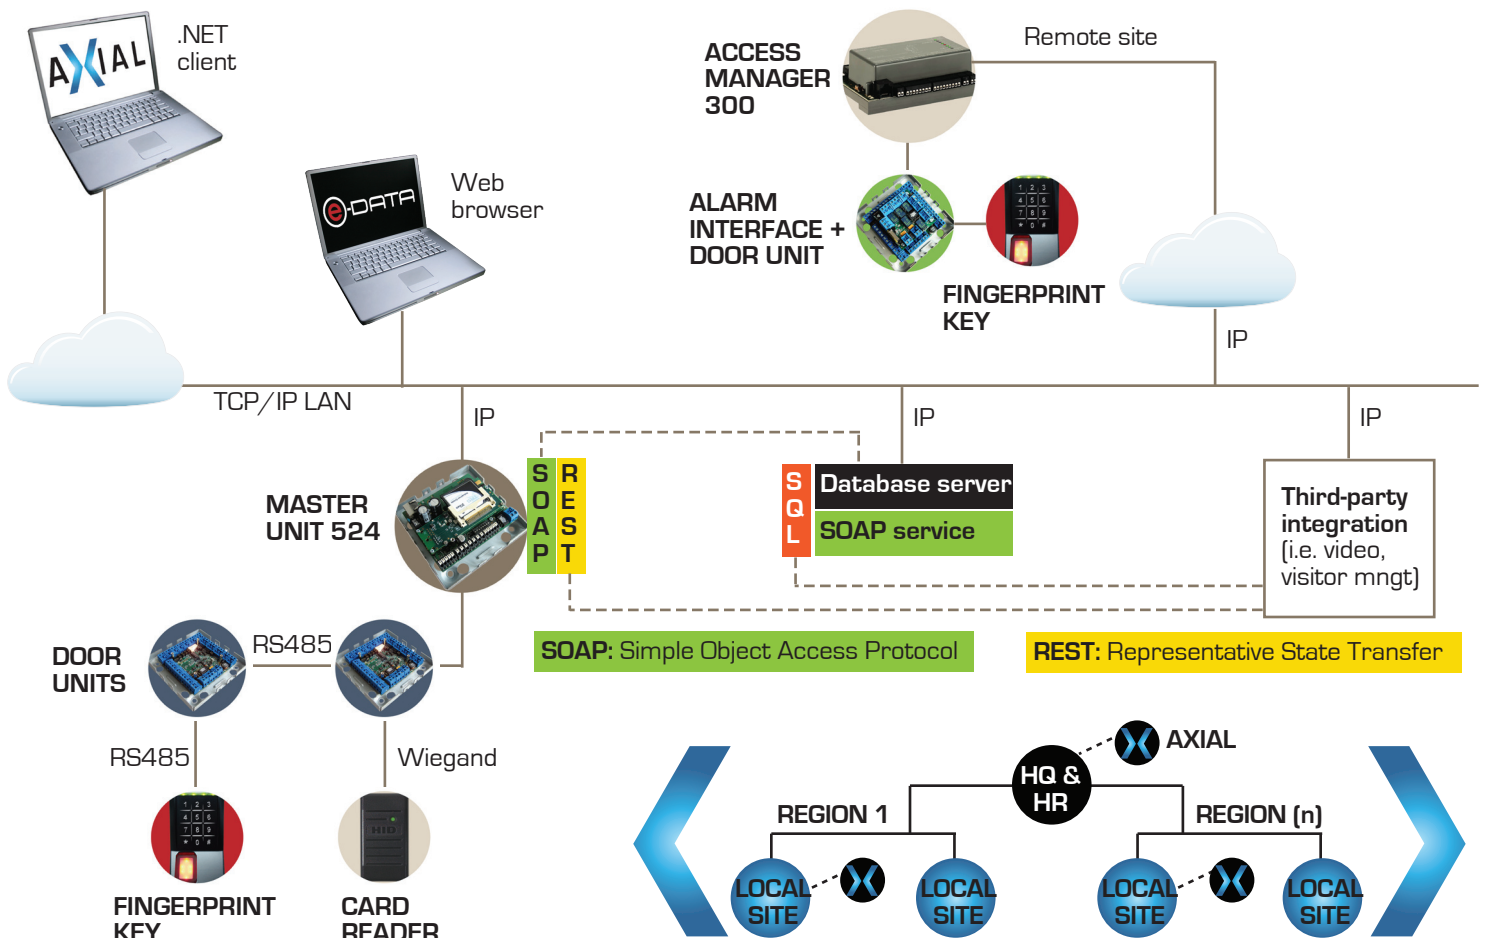

Additionally, all managed e-DATA systems forward their events to the AXIAL events database where system reports may be generated across one or many managed locations.

### WHERE IT WORKS

With partitioned visibility on a national or regional level, AXIAL is perfect for:

- Commercial & Retail
- Pharmacies
- Banks
- Government/Ports
- Schools
- Remote sites
- Data centers
